A World Rich in Biodiversity

• **short for biological diversity, is:**
  - the ______________________ of organisms in a given area
  - the ______________________ within a population
  - the variety of ______________________ in a community
  - the variety of ______________________ in an ecosystem.

• Certain areas of the planet, such as ______________________, contain an extraordinary variety of species.

Unknown Diversity

• The number of species known to science is about ______________________, most of which are ______________________.
  - Actual number of species on Earth is ______________________.
• New species are considered known when they are ______________________ scientifically.

Levels of Diversity

• Biodiversity can be studied and described at three levels:
  - ______________________
  - ______________________
  - ______________________

• Species diversity refers to all the ______________________ between populations of species, as well as between different species.
• Ecosystem diversity refers to the ______________________ of habitats, communities, and ecological processes within and between ecosystems.
• Genetic diversity refers to all the ______________________ contained within all members of a population.
• A ______________________ is a segment of DNA that is located in a chromosome and that code for a specific hereditary trait.

Benefits of Biodiversity

• Biodiversity can affect the ______________________ of ecosystems and the ______________________ of populations.

Species Are Connected to Ecosystems

• Every species is probably either ______________________ upon by at least one other species in ways that are not always obvious.
• A ______________________ is a species that is critical to the functioning of the ecosystem in which it lives because it affects the survival and abundance of many other species in its community.
• An example is the ______________________.
  - ______________________ increases the chances that some members of the population may survive environmental pressures or changes.
  - ______________________ are less likely to survive such pressures.

Species and Population Survival

• When a population shrinks, its genetic diversity ______________________ as though it is passing through a bottleneck.
  • The members of the population may then become more likely to ______________________ genetic diseases.

Medical and Industrial Uses

• About ______________________ of the drugs prescribed in the United States are derived from plants, and almost all of the antibiotics are derived from chemicals found in ______________________.
Agricultural Uses

- Most of the crops produced around the world originated from a few areas of biodiversity.
- Most new crop varieties are ____________________________, or crops developed by combing genetic material from other populations.

Ethics, Aesthetics, and Recreation

- ____________________________ is a form of tourism that supports the conservation and sustainable development of ecologically unique areas.

Chapter 10: Biodiversity
Section 2, Biodiversity at Risk

Biodiversity at Risk

- The extinction of many species in a relatively short period of time is called a ____________________________.

Current Extinctions

- The rate of extinctions is estimated to have increased by a multiple of ____________ since 1800, with up to 25 percent of all species on Earth becoming extinct between 1800 and 2100.
- The current mass extinction is different from those of the past because humans are the _____________ cause of the extinctions.

Species Prone to Extinction

- Large populations that adapt easily too many habitats are ____________________________ to become extinct.
- However, ____________________________ in limited areas can easily become extinct.
- Species that are especially at risk of extinction are those that ________________, those that need large or special habitats, and those that are exploited by humans.
- An ____________________________ is a species that has been identified to be in danger of extinction throughout all or a significant part of its range, and that is thus under protection by regulations or conservation measures.
- A ____________________________ is a species that has been identified to be likely to become endangered in the foreseeable future.

How Do Humans Cause Extinctions?

- The major causes of extinction today are
  - _______________________________________________________
  - _______________________________________________________
  - _______________________________________________________
  - _______________________________________________________

Habitat Destruction and Fragmentation

- In the process, we ______________________________________________ the habitats of other species.
- It is estimated that habitat loss causes almost ____________________________ of the extinctions now occurring.

Invasive Exotic Species

- An ____________________________ is a species that is not native to a particular region.
- Exotic species can ____________________________ native species that have no natural defenses against them.

Harvesting, Hunting, and Poaching

- ____________________________ is the illegal harvesting of fish, game, or other species.
Pollution
- The bald eagle was endangered because of a pesticide known as ______________________. Although DDT is now illegal to use in the United States, it is still manufactured here and used around the world.

Areas of Critical Biodiversity
- An ________________________________ is a species that is native to a particular place and that is found only there.
- Ecologists often use the numbers of endemic species of plants as an__________________________ of overall biodiversity because plants form the basis of ecosystems on land.

Tropical Rain Forests
- Biologist estimate that over half of the world’s species live in these forests even though they cover only ______________________ of the Earth’s land surface.

Coral Reefs and Coastal Ecosystem
- Nearly ______________________________ of Earth’s coral reefs are threatened by human activities, such as pollution, development along waterways, and overfishing.

Islands
- When an island rises from the sea, it is colonized by a ______________________________ of species from the mainland. These colonizing species may then evolve into several new species.

Biodiversity Hotspots
- The most threatened areas of high species diversity on Earth have been labeled ______________________ and include mostly tropical rainforests, coastal areas, and islands.
- Most of these hotspots have lost at least ______________________ of their original natural vegetation.

Biodiversity in the United States
- The United States includes a wide variety of unique ecosystems, including the ______________________, the California coastal region, Hawaii, the Midwestern prairies, and the forests of the Pacific Northwest.

Captive-Breeding Programs
- Wildlife experts may attempt to restore the population of a species through __________________________________________. These programs involve breeding species in ______________________, with the hopes of reintroducing populations to their natural habitats.
- This type of program has been used successfully with the ______________________, for example. But the question remains whether or not these restored populations will ever reproduce in the wild.

Preserving Genetic Material
- ________________________________ is hereditary material (chromosomes and genes) that is usually contained in the protoplasm of germ cells and may be stored as seeds, sperm, eggs, or pure DNA.

More Study Needed
- Also, small populations are ________________________________ to infectious diseases and genetic disorders caused by inbreeding.

Chapter 10: Biodiversity
Section 3, The Future of the Biodiversity

Saving Species One at a Time
- Methods to preserve individual species often involve __________________________________________ the species in captivity.

Preserving Genetic Material
- ________________________________ is hereditary material (chromosomes and genes) that is usually contained in the protoplasm of germ cells and may be stored as seeds, sperm, eggs, or pure DNA.

More Study Needed
- Also, small populations are ________________________________ to infectious diseases and genetic disorders caused by inbreeding.
Preserving Habitats and Ecosystems
• The most effective way to save species is to _______________________________ their habitats.
• Therefore, protecting the habitats of endangered and threatened species often means _______________________________ large areas.

Conservation Strategies
• One strategy is to _______________________________ areas of native habitat that can be preserved, restored, and linked into large networks.
• Another promising strategy is to _______________________________ products that have been harvested with sustainable practices.

Legal Protection for Species
• The _______________________________ is designed to protect any plant or animal species in danger of extinction.

U.S. Laws
• Under the first provision of the Endangered Species Act, the U.S. Fish and Wildlife Service (USFWS) must _______________________________ a list of all endangered and threatened species in the United States.
• As of 2002, _______________________________ species of plants and animals were listed.
• The second main provision of the act _______________________________ listed species from human harm.
• The third provision _______________________________ the federal government from carrying out any project that jeopardizes a listed species.

Recovery Plans
• Under the fourth main provision of the Endangered Species Act, the USFWS must _______________________________ a species recovery plan for each listed species.

Habitat Conservation Plans
• A _______________________________ is a land-use plan that attempts to protect threatened or endangered species across a given area by allowing some tradeoffs between harm to the species and additional conservation commitments among cooperating parties.

International Cooperation
• At the global level, the International Union for the Conservation of Nature and Natural Resources _______________________________ facilitates efforts to protect species and habitats.
• The IUCN publishes _______________________________ of species in danger of extinction around the world, advises governments on ways to manage their natural resources, and works with groups like the World Wildlife Fund to sponsor projects such as attempting to stop poaching in Uganda.

International Trade and Poaching
• One product of the IUCN has been an international treaty called _______________________________ (the Convention on International Trade in Endangered Species).
• The CITES treaty was the first effective effort to _______________________________ the slaughter of African elephants being killed by poachers who would then sell the ivory tusks.

The Biodiversity Treaty
• One of the most ambitious efforts to tackle environmental issues on a worldwide scale was the United Nations Conference on Environment and Development, also known as the first _______________________________. An important result of the Earth Summit was the Biodiversity Treaty.
• The _______________________________ is an international agreement aimed at strengthening national control and preservation of biological resources.

The Biodiversity Treaty
• The treaty’s goals are to _______________________________ biodiversity and ensure the sustainable and fair use of genetic resources in all countries.
